Time-Current-Curves

Rated Current $I_n < 3\text{ A}$

Multiple of Rated Current I_n

Ambient temperature $+23^\circ$

Rated Current $3\text{ A} \geq I_n < 18\text{ A}$

Multiple of Rated Current I_n

Ambient temperature $+23^\circ$

Rated Current $I_n \geq 18$ A

Effect of ambient temperature

The units are calibrated for an ambient temperature of +23°C. To determine the rated current for a lower or higher ambient temperature, use a correction factor (typical value) from the table below:

Ambient Temperature [°C]	Correction factor
-10	0.89
-5	0.91
0	0.92
+23	1.00
+30	1.03
+40	1.08
+55	1.16

Example: With a nominal current of 5A and an ambient temperature of 40°C, a correction factor of 1.08 results. This results in a nominal current of 5.5 A, which is rounded up to the next higher nominal current 6 A.
